Examiner  
Kevin Burd

Art Unit  
2631

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

## Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136 (a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on Jan 24, 2003.
- 2a) ☒ This action is FINAL. 2b) ☐ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 1-7 is/are pending in the application.
- 4a) Of the above, claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-7 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claims \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
- 11) ☐ The proposed drawing correction filed on \_\_\_\_\_ is: a) ☐ approved b) ☐ disapproved by the Examiner.  
If approved, corrected drawings are required in reply to this Office action.
- 12) ☐ The oath or declaration is objected to by the Examiner.

## Priority under 35 U.S.C. §§ 119 and 120

- 13) ☐ Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some\* c) ☐ None of:  
1. ☐ Certified copies of the priority documents have been received.  
2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.  
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).  
\*See the attached detailed Office action for a list of the certified copies not received.
- 14) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).  
a) ☐ The translation of the foreign language provisional application has been received.
- 15) ☐ Acknowledgement is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892) 4) ☐ Interview Summary (PTO-413) Paper No(s). \_\_\_\_\_
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-948) 5) ☐ Notice of Informal Patent Application (PTO-152)
- 3) ☐ Information Disclosure Statement(s) (PTO-1449) Paper No(s). \_\_\_\_\_ 6) ☐ Other:

Art Unit: 2631

## DETAILED ACTION

1. This office action, in response to the amendment filed 1/24/2003, is a final office action.

### ***Claim Rejections - 35 USC § 103***

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

3. Claims 1 and 5 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miya et al (US 6,351,458) in view of Chalmers (US 5,375,146).

Regarding claims 1 and 5, Miya discloses an interpolation type synchronous detection system (column 3, lines 1-19). Pilot symbols are periodically interpolated in information symbols to be transmitted, the transfer function is estimated and detection is carried out. Figure 11 illustrates an example of the channel format. Miya does not disclose updating at a middle point of the data frame a reception sampling point. However, Chalmers discloses the circuit shifts the sample timing phase so that the sampling occurs at the maximum opening of the receiver eye pattern (i.e. sampling in the middle of a digital symbol) to minimize intersymbol interference (column 13, lines

Art Unit: 2631

19-23). This allows the interpolation synchronous detection in the receiver (column 14, lines 34-38). It would have been obvious of one of ordinary skill in the art to shift the sample timing phase so the sampling occurs at the middle point to minimize intersymbol interference as disclosed by Chalmers in the method and system of Miya.

4. Claims 2, 4 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miya et al (US 6,351,458) in view of Yamada et al (US 5,822,364) further in view of Chalmers (US 5,375,146).

Regarding claims 2, 4 and 7, Miya discloses an interpolation type synchronous detection system (column 3, lines 1-19). Pilot symbols are periodically interpolated in information symbols to be transmitted, the transfer function is estimated and detection is carried out. Figure 11 illustrates an example of the channel format. Miya does not disclose using the complex conjugate for performing the coherent detection. Yamada discloses the demodulated data is obtained after completion of the pilot coherent detection scheme with interpolation using the complex conjugate as stated in column 1, lines 11-38. This is a critical component of correctly computing the coherent detection. It would have been obvious for one of ordinary skill in the art at the time of the invention to combine the coherent detection scheme of Yamada into the detection scheme of Miya to ensure the correct values are detected. In addition, Miya does not disclose updating at a middle point of the data frame a reception sampling point. However,

Art Unit: 2631

Chalmers discloses the circuit shifts the sample timing phase so that the sampling occurs at the maximum opening of the receiver eye pattern (i.e. sampling in the middle of a digital symbol) to minimize intersymbol interference (column 13, lines 19-23). This allows the interpolation synchronous detection in the receiver (column 14, lines 34-38). It would have been obvious of one of ordinary skill in the art to shift the sample timing phase so the sampling occurs at the middle point to minimize intersymbol interference as disclosed by Chalmers in the method and system of the combination of Miya and Yamada.

5. Claims 1, 5 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over Vasic (US 6,178,194) in view of Chalmers (US 5,375,146).

Regarding claims 1 and 5, Vasic discloses a receiver, which interpolates the channel measurement provided by the pilot symbols to obtain a phase and amplitude reference for coherent detection (column 3, lines 16-19). The transfer function of the channel is estimated by using the pilot symbols and the data symbols are detected on the basis of the estimated transfer function (column 3, lines 14-32). The data channel is shown in figure 1. Vasic does not disclose updating at a middle point of the data frame a reception sampling point. However, Chalmers discloses the circuit shifts the sample timing phase so that the sampling occurs at the maximum opening of the receiver eye pattern (i.e. sampling in the middle of a digital symbol) to minimize intersymbol

Art Unit: 2631

interference (column 13, lines 19-23). This allows the interpolation synchronous detection in the receiver (column 14, lines 34-38). It would have been obvious of one of ordinary skill in the art to shift the sample timing phase so the sampling occurs at the middle point to minimize intersymbol interference as disclosed by Chalmers in the method and system of Vasic.

Regarding claim 6, Vasic discloses a closed loop system that controls the gain in order to maintain optimal transmit power (column 2, lines 49-67).

6. Claims 2-4 and 7 are rejected under 35 U.S.C. 103(a) as being unpatentable over Vasic (US 6,178,194) in view of Yamada et al (US 5,822,364) further in view of Chalmers (US 5,375,146).

Regarding claims 2, 4 and 7, Vasic discloses a receiver, which interpolates the channel measurement provided by the pilot symbols to obtain a phase and amplitude reference for coherent detection (column 3, lines 16-19). The transfer function of the channel is estimated by using the pilot symbols and the data symbols are detected on the basis of the estimated transfer function (column 3, lines 14-32). The data channel is shown in figure 1. Vasic does not disclose using the complex conjugate for performing the coherent detection. Yamada discloses the demodulated data is obtained after completion of the pilot coherent detection scheme with interpolation using the complex conjugate as stated in column 1, lines 11-38. This is a critical component of correctly

Art Unit: 2631

computing the coherent detection. It would have been obvious for one of ordinary skill in the art at the time of the invention to combine the coherent detection scheme of Yamada into the detection scheme of Vasic to ensure the correct values are detected. In addition, Vasic does not disclose updating at a middle point of the data frame a reception sampling point. However, Chalmers discloses the circuit shifts the sample timing phase so that the sampling occurs at the maximum opening of the receiver eye pattern (i.e. sampling in the middle of a digital symbol) to minimize intersymbol interference (column 13, lines 19-23). This allows the interpolation synchronous detection in the receiver (column 14, lines 34-38). It would have been obvious of one of ordinary skill in the art to shift the sample timing phase so the sampling occurs at the middle point to minimize intersymbol interference as disclosed by Chalmers in the method and system of the combination of Vasic and Yamada.

Regarding claim 3, Vasic discloses a closed loop system that controls the gain in order to maintain optimal transmit power (column 2, lines 49-67).

7. Claims 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Higashi et al (US 5,692,015) in view of Yamada et al (US 5,822,364) further in view of Chalmers (US 5,375,146).

Regarding claims 7, Higashi discloses a coherent detection method and system including a step of estimating a transfer function using pilot signals (abstract). The step

Art Unit: 2631

of estimating the transfer function including using pilot symbols contained in the received signal as well as pilot symbols generated from a pilot symbol generator (column 5, lines 32-42). The pilot symbols are located before and after the information signal (figure 1). Detection occurs by interpolating the transfer function. The circuit is shown in figure 3. Higashi does not disclose using the complex conjugate for performing the coherent detection. Yamada discloses the demodulated data is obtained after completion of the pilot coherent detection scheme with interpolation using the complex conjugate as stated in column 1, lines 11-38. This is a critical component of correctly computing the coherent detection. It would have been obvious for one of ordinary skill in the art at the time of the invention to combine the coherent detection scheme of Yamada into the detection scheme of Higashi to ensure the correct values are detected. In addition, Higashi does not disclose updating at a middle point of the data frame a reception sampling point. However, Chalmers discloses the circuit shifts the sample timing phase so that the sampling occurs at the maximum opening of the receiver eye pattern (i.e. sampling in the middle of a digital symbol) to minimize intersymbol interference (column 13, lines 19-23). This allows the interpolation synchronous detection in the receiver (column 14, lines 34-38). It would have been obvious of one of ordinary skill in the art to shift the sample timing phase so the sampling occurs at the middle point to minimize intersymbol interference as disclosed by Chalmers in the method and system of the combination of Higashi and Yamada.

Art Unit: 2631

***Conclusion***

8. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

***Contact Information***

**Any response to this final action should be mailed to:**

**Box AF**

Commissioner of Patents and Trademarks  
Washington, D.C. 20231

**or faxed to:**

Art Unit: 2631

(703) 872-9314, (for formal communications; please mark "EXPEDITED PROCEDURE" or for informal or draft communications, please label "PROPOSED" or "DRAFT")

Hand-delivered responses should be brought to Crystal Park II, 2121 Crystal Drive, Arlington, VA., Sixth Floor (Receptionist).

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kevin Burd, whose telephone number is (703) 308-7034. The Examiner can normally be reached on Monday-Thursday from 9:00 AM - 6:00 PM.

Any inquiry of a general nature or relating to the status of this application should be directed to the Group receptionist whose telephone number is (703) 305-3800.
